# Klaviyo welcome flow: diagnosis checklist

Emmanuel Marquez · Email Developer · What I check, in order, when a welcome flow sends the wrong emails or nothing at all.

| Check | What usually breaks | Fix |
|---|---|---|
| **1. Trigger** | The flow is triggered by a different list than the signup form actually adds people to, or by a segment (which only adds people once they qualify). | Point the trigger at the form's list, and confirm the form → list mapping in Sign-up forms. |
| **2. Double opt-in** | The list uses double opt-in, so nobody enters the flow until they click the confirmation email. | Decide whether double opt-in should stay. If it stays, check the confirmation email is being delivered and clicked. |
| **3. Trigger and flow filters** | A filter like "Placed Order zero times" or "Is in list X" removes everyone. Flow filters are re-checked before every email. | Remove or narrow the filter, then preview it against a real test profile. |
| **4. Message status** | The flow says Live but individual emails are still Draft or Manual, so they're skipped or queued. | Set each message to Live and clear the "Manual" queue if needed. |
| **5. Delays and timing** | Delays are too long or in the wrong order. "Send at a specific time" pushes emails to the next day. | Re-set the delays (e.g. 0 min, 2 days, 4 days) and check the time-zone settings. |
| **6. Smart Sending and consent** | Smart Sending skips people who got another email recently. Profiles without email consent are suppressed. | Turn Smart Sending off for welcome emails and confirm subscribers have consent. |
| **7. Coupon and dynamic content** | The coupon in `{% coupon_code '…' %}` doesn't match a Klaviyo coupon name, or has expired. | Match the coupon name exactly and check its expiry and Shopify sync. |
| **8. Re-entry and duplicates** | Re-entry is off, so people who signed up before never get it. Or two flows (popup and footer form) both fire. | Set the re-entry rule you want and merge or exclude the duplicate flow. |

## How I'd test it

1. Sign up with a fresh test email (plus addressing) through the live form.
2. Watch the profile's activity feed: added to list, entered flow, each email's status (sent, skipped and why).
3. Temporarily shorten the delays to confirm every step sends, then restore the real timing.
4. Send you a short summary: what was broken, what I changed, and the screenshots.
