Braze action-based email: wishlist price drop

Emmanuel Marquez · HTML Email Developer · Concept build for a fictional brand, made for this proposal.

Mobile, light (375px, top of email)

Mobile, dark (prefers-color-scheme)

What the Liquid does

- **Trigger:** custom event `wishlist_price_drop`. Product name, image, URL and prices come from `event_properties`.
- **Abort logic:** `abort_message()` stops the send if product data is missing or the new price isn't actually lower, so a bad event never reaches the inbox.
- **Calculated content:** percent off is computed in Liquid and used in the subject-line-ready preheader and headline.
- **Custom attributes:** `loyalty_tier` and `points_balance` switch the perk block (Gold / points / join).
- **Connected Content:** recommendations API saved to `recs`. The section only renders when 2+ items come back, so a slow or empty API doesn't leave a broken block.
- **Tracking:** UTMs built once with `{{campaign.${name} | url_encode}}` and reused on every link.
- **Compliance:** `{{${set_user_to_unsubscribed_url}}}` and the preference center link in the footer.
- **Fallbacks:** `default:` on first name and tier.

Build

- Hand-coded tables, inline CSS, 600px with fluid mobile stacking.
- Bulletproof VML button for Outlook desktop; live-text CTA everywhere else.
- Dark mode: color-scheme meta, prefers-color-scheme palette, logo swap, `[data-ogsc]` for Outlook apps.
- Absolute image URLs with explicit width/height and alt text.

Liquid setup (top of the message)

```
{% assign old_price = event_properties.${old_price} | plus: 0 %}
{% assign new_price = event_properties.${new_price} | plus: 0 %}
{% if event_properties.${product_name} == blank or event_properties.${image_url} == blank or new_price >= old_price %}
  {% abort_message('wishlist_price_drop: missing product data or no real price drop') %}
{% endif %}
{% assign pct_off = old_price | minus: new_price | times: 100 | divided_by: old_price | round %}
{% assign tier = custom_attribute.${loyalty_tier} | default: 'Member' %}
{% capture utm %}utm_source=braze&utm_medium=email&utm_campaign={{campaign.${name} | url_encode}}{% endcapture %}
{% connected_content https://api.ridgeline.example/v1/recs?sku={{event_properties.${sku} | url_encode}}&limit=2 :save recs %}
```

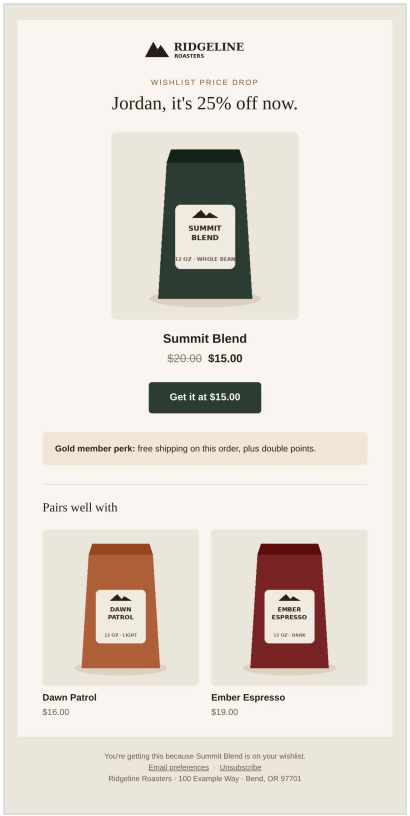

Connected Content section (renders only with 2+ recommendations)

```
{% if recs.products.size >= 2 %}
<tr><td>
<p>Pairs well with</p>
</td></tr>
<tr><td>
<table role="presentation" width="100%" cellpadding="0" cellspacing="0" border="0"><tr>
{% for p in recs.products limit:2 %}
<td class="stack {% if forloop.first %}stack-gap{% endif %}" width="50%" valign="top" style="...">
<a href="{{p.url}}?{{utm}}"><img src="{{p.image}}" alt="{{p.name}}" ...></a>
<p ...>{{p.name}}</p>
<p ...>${{p.price}}</p>
</td>
{% endfor %}
```

QA I run before every send

- Preview as multiple test users in Braze: Gold, points holder, no tier, missing first name. Plus a test event with a missing image to confirm the abort fires.
- Litmus / Email on Acid: Apple Mail iOS/macOS, Gmail iOS/Android/web and Outlook desktop/new Outlook, in light and dark mode.
- Link check with UTMs, the unsubscribe and preference center links, the Connected Content timeout behavior, and segment / rate-limit settings before scheduling.

Desktop render (640px), light

Screenshots are Chromium renders of the template with mock data (event: Summit Blend, $20.00 to $15.00; tier: Gold; 2 recommendations). The full source (braze_pricedrop.braze.html) is attached and ready to paste into a Braze HTML email.
